

Aon Benfield Analytics

Single Risk ModelingSM

Aon Benfield is the first reinsurance intermediary to bring its clients individual risk modeling results. Single Risk Modeling, a feature of ExposureView™, Aon Benfield's award-winning analytics and risk mapping platform, enables clients to quickly obtain the most accurate and comprehensive modeled loss results during the underwriting process. From ExposureView, agents or underwriters enter details about a specific risk and launch the analysis. Within seconds, the results are returned, including average annual loss and 100- and 250-year EP points. Single Risk Modeling results are identical to what a detailed portfolio analysis would provide.

The Single Risk Modeling Advantage

- **Most accurate results based on street address geocoding.** This feature uses the actual street address to geocode the risk, as opposed to a ZIP Code or grid approximation model, which can be quite inaccurate for a specific policy, especially one with greater exposure to cat losses.
- **Detailed modeling of risk characteristics.** No shortcuts are used, as all the features of an individual risk are modeled. Characteristics such as construction type, year built, roof geometry, and numerous other modifiers can be used to further define the results.
- **Fully integrated with ExposureView.** With the full power of ExposureView, clients can view the risk with aerial and satellite imagery, identify nearby terrorist targets or sinkholes, track neighborhood accumulations, and a host of other functions.
